```
copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant Agfa protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant Agfa protein which is useful for the expression of recombinant Agfa protein which is useful for useful for the expression of recombinant post on this animal in a system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogens(city and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response immunogens, in inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SDARKSETTITQSGYGNGADVGQGADNYDQLVTRVVTHEMAHADQWNAKNSDITVGQYGG 120

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (I) use of thin aggregative finbriae (SEPI/TAPE) mucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterbacteriaceae for the production of fimbriae comprising recombinant of a recombinant gene into the chromosome of the C AgfA, CsgA and AgfA-homologue fimbrin subunits, respectively; (2) directing recombination of a recombinant gene into the chromosome of the homologus species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, copy of that gene; and maino acid polymer comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the copy of the animal in conjunction with a carrier or diluent. (I) is cuseful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a fimbrial presentation system the heerologus antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogens, which may be important for directing an immunogense or purify in large amount. The present sequence is given in the example first and adhesion properties relevant for an efficient incomplement the example fimbrial subunit proteins are easy and consense the example finbrial invention invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                2

cc thin aggregative fimbriae (SEF17/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and content of Strains of Salmonella, Escherichia coli and Strains of Strains of Fimbriae comprising recombinant of directing recombination submits, respectively; (2) directing recombination of a recombination of a recombinant gene into the chromosome of the homologous species; (3) directing recombination of a recombinant gene copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant AgfA comprising separating an amino acid polymer comprising a recombinant of protein containing a replacement segment or segments of foreign amino cortaining a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or cortained home or sequences grown on a Salmonella, E. coli or cortained home or sequences grown on a Salmonella, C. coli or cortained home or sequences grown and salmonella, E. coli or cortained home or sequences grown and salmonella, E. coli or cortained home or sequence in an animal. In a fimbrial presentation electricing an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to concine, the carrier fimbrial submit protein sequence in the carrier fimbrial submit proteins are usually strong immunopensive to purify in large amount. The present sequence is given in concine, the exemplification of the present invention

back into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, copy of that gene; and (4) eliciting an immune response in an animal, protein containing a replacement segment or segments of foreign animal protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, B. coli or fine the mainterpolate animal in colination with a carrier or diluent. (I) is believed animal in colination with a carrier or diluent. (I) is useful for the expression of recombinant Agfa protein which is useful for the expression of recombinant Agfa protein which is useful for system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid finbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61 SDARKSETTITQSGYGNGADVGQGADNSTIELTQNGFRNNATYDQLVTRVVTHEMAHA-- 118
                                                                          The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (I) use of thin aggregative fimbriae (SETI//TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant AgfA. CsgA and AgfA-homologue filmbrin subunits, respectively; (2) directing recombination of a recombinant gene into the chromosome of the homologous species; (3) directing recombinant gene into a recombinant gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 MKLLKVAAFAAIVVSGSALAGVVPQWGGGGNHNGGGNSSGPDSTLSIYQYGSANAALALQ

                                                                                                                                                                  The present sequence represents agfA encoded by the full agfA gene derived from Salmonella enteritidis 27655-3b. The nucleic acid can be used to provide diagnostic assays for Salmonella and/or enteropathogenic bacteria of the family Enterobacteria. It can also be used to provide proteins and antibodies which can be used for assays. The nucleic acid sequence can be used to provide probes or primers which can specifically hybridise to nucleic acid molecules from greater than 99% of Salmonella acid molecules from greater than 99% of Salmonella acid molecules from virtually all other microbial organisms. (Updated on 25-MAR-2003 to correct PF field.)

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA control of the gene has been replaced by a segment of a foreign DNA control of this segment of a foreign by the control of this aggregative finbriae (SEPI/TAP) mucleation depended assembly system of strains of Salmonella Eschericha coli and control of strains of finbriae comprising recombinant of Enterobacteriacae for the production of finbriae comprising recombination of a recombination of a recombinant gene into the chromosome of the homologous species, (3) directing recombination of a recombinant gene control of a recombinant gene into the chromosome of the homologous species, replacing the native comprising separating an amino acid polymer comprising a recombinant page.

Comprising separating an amino acid polymer comprising a recombinant page comprising separating an amino acid polymer comprising a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the control of the animal in conjunction which a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful for useful for the expression of recombinant AgfA protein which is useful consistent the hererologous antigens are presented in high numbers (up to system the hererologous antigens are presented in high numbers (up to system the hererologous antigens are presented in high numbers (up to vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response in anymore. The present sequence is given in the exemplification of the present invention invention in the exemple of the present invention.
                                                                                                                                                                                                                                           Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                        Kay WW,

The present invention describes a recombinant agfA gene (1) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbries (SEPI)/TAP) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enteropacteriacae for the production of fimbriae comprising recombinant of Enteropacteriacae for the production of fimbriae comprising recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of the chromosome of the homologous species, replacing the native copy of that gene, and (4) eliciting an immune response in an animal, copy of that gene, and (4) eliciting an immune response in an animal, copy of that gene, and (4) eliciting an immune response in an animal, copy of that gene or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence the animal in conjunction which a carrier or diluent. (1) is useful for the expression of recombinant AgfA protein which is useful for the expression of recombinant AgfA protein which the carrier fimbrial submit protein possesses both the immunogens, which may be important for allecting an immune response in an animal in conjuncting in the carrier fimbrial submit proteins are usually strong immunogens, which may be important for directing an immune response in expensive to purify in large amount. The present sequence is given in the exemplification of the present invention received the present invention received the present invention received the present invention received to purify in large amount. The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA casequence which encodes a foreign epicope or antigen. Also described are: (1) use of thin aggregative fimbries (SEPI7/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and casembly system of strains of Salmonella, Escherichia coli and casembly system of strains of Salmonella, Escherichia coli and directing recombination of fimbriase comprising recombination of a recombination of a recombination of a recombinant gene into the chromosome of the homologous species, (3) directing recombination of a recombinant gene copy of that gene, and (4) eliciting an immune response in an animal. Comprising separating an amino acid polymer comprising a recombinant pactor or sequence or sequences grown on a Salmonella, E. coli or comprising separating an amino acid polymer comprising a replacement segment or sequence or sequences grown on a Salmonella, E. coli or comprising case bost cell, from the host cell and introducing the protein to the expression of recombinant AgfA protein which is useful for useful for the expression of recombinant AgfA protein which is useful for system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrial in for directing an immunogens, which may be important for directing an immunogens, which may be important for directing an immune response in an animal in respect the inserted epitope, and hybrid fimbriae are easy and intention in a signification in the carrier the inserted epitope, and hybrid fimbriae are easy and intention in the carrier of inserted epitope, and hybrid fimbriae are easy and additional in the carrier of inserted epitope, and hybrid fimbriae are easy and intention in the carrier financial subunit proteins are usually strong incoments to manify, in larva and hybrid fimbriae are easy and additional and an animal manimal maniform.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                       Salmonella, agfA, chromosomal gene replacement, fimbrin, epitope, vaccine, immune response, immunogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          77.8%; Score 604; DB 3; Length 151;

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA segment of thin aggregative finbriae (SER17/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant of a recombinant gene into the chromosome of the homologous species; (3) directing recombinant gene into the chromosome of the homologous species; (3) directing recombinant gene into the chromosome of the homologous species; replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the coll sequence the arrival in an animal. In a fimbrial presentation a useful for the expression of recombinant AgfA protein which is useful for the expression of recombinant AgfA protein which is useful for the the hybrid finbrian protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit protein sequence is given in against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a recombinant agfA gene (1) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative finbriae (SBF17/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and harterobacteriaceae for the production of finbriae comprising recombinant AgfA, CsgA and AgfA-homologue finbrin subunits, respectively; (2) directing recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a relative comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or
                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.

Also described are:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9
Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a fimbrial presentation system the heterologue antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 MKLLKVAAFAAIVVSGSALAGVVPQWGGGGNHNGGGNSSGPDSTLSIYQYGSANAALALO

casembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and anterobacteriaceae for the production of fimbria comprising recombinant CC AgrA, cSgA and AgrA-homologue fimbrin subunits, respectively; (2) directing recombination of a recombinant gene into the chromosome of the homologous species, replacing the chromosome of the homologous species, replacing the native comprising separating an amino acid polymer comprising recombinant AgrA protein containing a replacement segment or segments of foreign amino acid polymer comprising a recombinant AgrA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequence strong man as a man a salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequence of recombinant AgrA protein which is useful for useful for the expression of recombinant AgrA protein which is useful for useful for the expression of recombinant AgrA protein mumbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the rearrier fimbrial subunit protein possesses both the vaccine, the carrier fimbrial subunit protein are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and immunogens, which may be important for present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are:

(I) use of thin aggregative finbriae (SEP1/7AF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Encoded the species of the production of finbriae comprising recombinant of directing recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of copy of that gene; and (4) eliciting an immune response in an animal. Copy of that gene; and (4) eliciting an immune response in an animal or protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a salmonella, E. coli or acid sequence or sequences grown on a salmonella, E. coli or acid sequence or sequences grown on a salmonella, E. coli or acid sequence or sequences grown on a salmonella, E. coli or acid sequence or sequences grown on the host cell, from the host cell and introducing the protein which is useful for the expression of recombinant AgfA protein which is useful for system the heterologous antigens are presented in high numbers (up to solo, 000 copies/cell), the hybrid finbrin protein possesses both the immunogens which may be importent for an efficient liver in amunogens, which may be importent for an event acanally strong immunogens, which may be importent for an event acanally in the provent of against th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

                                           Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             09
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 MKLLKVAAFAAIVVSGSALAGVVPQWGGGGNHNGGCNSSGPDSTLSIYQYGSANAALALQ

The invention relates to an isolated peptide capable of binding a mammal selected from sequences shown in ABRA2642, ABRA2648-49. The peptide or antibody is useful for tracting a baselectial infection in a human or animal or in the manufacture of a medicament for the prophylactic treatment of a bacterial infection, such as Escherichia coli, Salmonella or Shigalla infection. The peptide that is immobilized on a solid support is also useful as a reagent for determining the ability of a plasma protein to bind to bacteria. The present sequence represents an E. coli
                                                                                                                                                                                                                                                                                                                                                                           New isolated peptide capable of binding a mammalian plasma protein, useful in the manufacture of a medicament for the prevention and/or treatment of a bacterial infection, such as Escherichia coli, Salmonella or Shigella infections.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           \delta
                                                                                                                                                                                                                                                                                                                                       The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative finbriae (SEPA)/TAP) nucleation depended assembly system of strains of Salmonella Escherichia coli and Enteropacteriacae for the production of fimbriae comprising recombinant of Enteropagous species; (3) directing recombination of a recombination of a recombinant gene into the chromosome of the homologous species; (3) directing recombination of a recombinant gene back into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or useful for the expression of recombinant AgfA protein which is useful for useful for the carrier finding an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to sequence, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response in expensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                        Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9

APPLICANT: KUNIO NAKASHIMA et al.

TITLE OF INVENTION: NOVEL POLYPEPTIDE GENE CDNA, VECTOR

TITLE OF INVENTION: CONTAINING SAID CDNA, HOST CELLS TRANSFORMED WITH SAID

TITLE OF INVENTION: VECTOR, POLYPEPTIDE PRODUCED THEREBY, METHOD OF PRODUCING

TITLE OF INVENTION: SAID POLYPEPTIDE, DNA ENCODING SAID POLYPEPTIDE AND ANTIBODY

TITLE OF INVENTION: TO SAID POLYPEPTIDE

NUMBER OF SEQUENCES: 4

Sequence 180, Application US/09620412C

Patent No. 6448234

GENERAL INFORMATION:

APPLICANT: Steven P. Fling

TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR TREATMENT AND

TITLE OF INVENTION: DIAGNOSIS OF CHLAMYDIAL INFECTION

TITLE OF INVENTION: DIAGNOSIS OF CHLAMYDIAL INFECTION

CURRENT APPLICATION NUMBER: US/09/620,412C

CURRENT FILING DATE: 2000-07-20

NUMBER OF SEQ ID NOS: 363

SOFTWARE: FastSEQ for Windows Version 3.0/4.0

SEQ ID NO 180

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
